In the small town of Pallet, a gentle breeze played with the leaves as young trainers gathered for the annual Pokémon Festival. Excitement bubbled in the air; children dressed in costumes, eager to begin their journeys, while seasoned trainers recounted tales of their grand adventures. It was here that Ash, Misty, and Brock found themselves discussing rumours of a legendary device said to unite the powers of math and Pokémon. According to Professor Oak, this mythical "Calculation Circuit" could be the key to unlocking a new era in Pokémon battles. But where was it hidden? The only clue: "Where numbers align, the true path begins. "As the festivities continued, Ash's Pikachu darted into the crowd, only to return with a strange envelope. Sealed with a Poké Ball insignia, the letter inside read: "To unlock what you seek, follow the seven steps of logic. Each step is hidden in plain sight." Nothing else. The hunt was on. Their first destination was the library, a bastion of ancient Pokémon lore and riddles. Brock scanned the bookshelves, finding volumes on Unown language, mathematical puzzles, and unusual Pokémon types. Misty noticed that the Dewgong statue in the center of the room had a plague reading: "The sum divides the secrets, but the answer multiplies." It felt significant, but the meaning escaped them for now. Nearby, a Sandshrew was tapping rhythmically on a calculatorshaped stone embedded in the floor. "Look at that!" exclaimed Ash. "Even the Pokémon are giving us hints." They knelt down and noticed peculiar markings along the stone: a string of numbers and letters, almost like a coded message. Misty jotted it down, convinced it would come into play later in their adventure. Outside, the trio met Professor Oak, who greeted them with his customary smile. "Ah, young Trainers! If you wish to uncover the hidden circuit, you'll need to exercise both your battling skills and your wits. Start simple sometimes, the answer is right in front of you." He handed Ash a blank notebook, saying, "Use this to record your discoveries. And

remember: not all clues look like clues. "As sunset approached, the path led them through a field dotted with Nido ran and Bell sprout. The sky turned gold, casting long shadows that seemed to point toward an old observatory on the hill. "Let's check it out!" said Ash.Inside, they found an abandoned computer terminal. The screen was dark, but Brock noticed a faded sticker on the monitor. He scribbled it into the notebook, unsure of its purpose, but certain that it was another piece of the puzzle. The observatory was filled with relics from past generations: dusty telescopes, star charts, and pieces of mysterious circuitry that hummed when touched. Misty gazed out the window at the endless, star-filled sky. "It feels like every piece of this journey is coming together," she mused. "But how do we use all these hints?" Ash flipped through the blank pages of the notebook, drawing connections between the numbers, the symbols, and the calculator link. Professor Oak's words echoed in his mind: "Start simple." Could the calculator website hold the next step in their quest? Brock guessed as much, but they decided to gather more clues before diving in.

Eager to investigate further, the group trekked east toward Saffron City, where the mighty Silph Co. towered above the skyline. On the building's electronic billboard, strange equations flashed between advertisements for Poké Balls and Potions. Ash noticed a fleeting image—the shape of a calculator—appear between two major products. They snapped a picture, unsure if it was a coincidence, or another deliberate message left for them.At Silph Co.'s entrance, a cheerful receptionist handed them a flyer for the "Logic League," inviting trainers to test their skills on digital puzzles accessible via a special link. "Participants who solve the final equation will be rewarded with a unique Pokémon Egg!" she said, winking. Another clue to add to the notebook, but nothing seemed to connect—yet.Night fell as our heroes rested at the Pokémon Center, reviewing the clues. The link from the observatory lingered in their minds—

especially as Nurse Joy mentioned a recent influx of trainers seeking "number-based enlightenment." Ash absent-mindedly clicked the pen, sketching circuits and calculators in the margins of the notebook. "Maybe we should visit the website and see what it does," Brock suggested. "If Oak said to start simple, maybe the simplest answer is just to try it." With a cautious nod from Misty, Ash typed the mysterious link into his Pokégear. The screen flickered, and a simple calculator interface appeared. "Is this it?" he wondered. They experimented with the calculator, noting that certain numbers produced unique patterns, as if encoding the next phase of their quest. The next morning, the trio awoke to find a new clue in the notebook, inked in an elegant, looping script: "Every journey begins with a blank page, but true discovery unfolds as you calculate each step." They realized the journey wasn't just about solving puzzles—it was about paying attention to the subtle connections between each part of the adventure. Determined to master the secrets of logic and numbers, Ash, Misty, and Brock set off toward their next challenge, their notebook in hand and the spark of curiosity burning brighter than ever. With each discovery, the boundaries between the world of Pokémon and the world of numbers grew thinner—until, at the very center, they'd uncover the legendary Calculation Circuit and claim their place among the greatest Trainers in history. In the small town of Pallet, a gentle breeze played with the leaves as young trainers gathered for the annual Pokémon Festival.
